

AZURE AI FOUNDRY LAB – C6

Title :

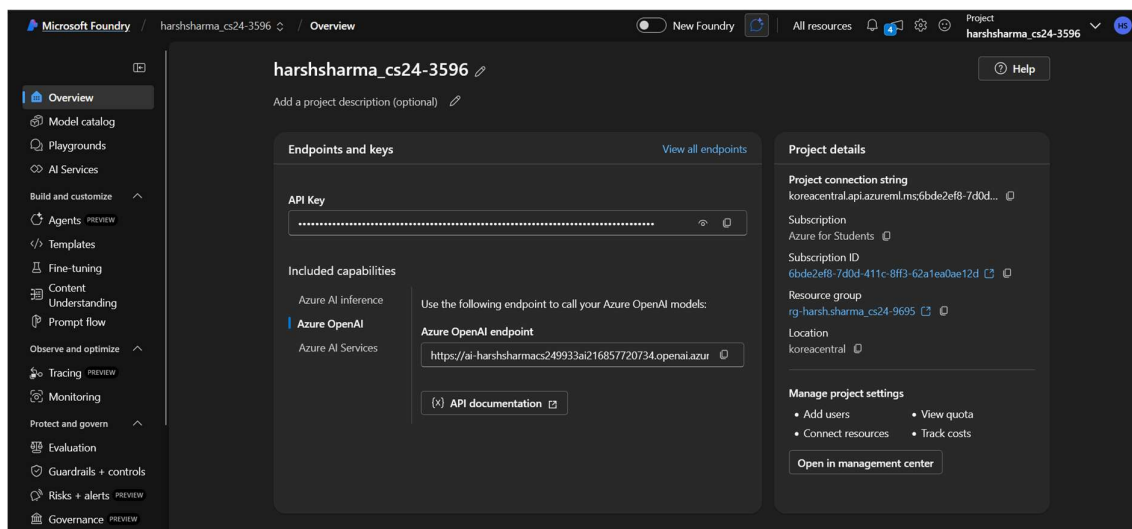

Create and Deploy a Prompt Flow using Azure AI Foundry.

Objective :

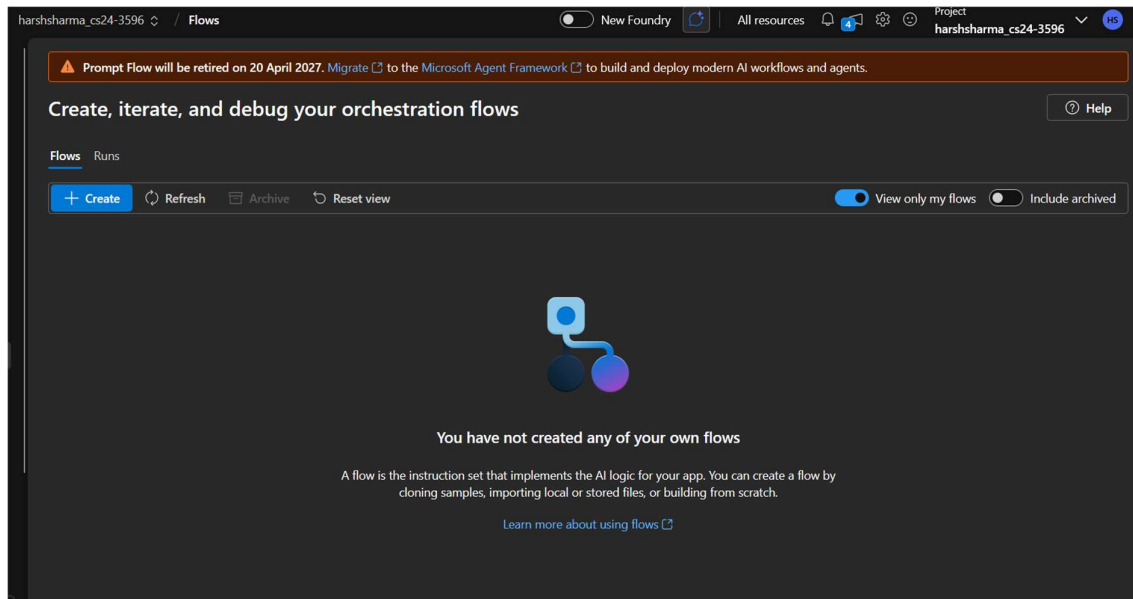

To learn how to create, configure, test, and deploy a Prompt Flow in Azure AI Foundry using a GPT-4o model and evaluate its conversational capabilities through a travel assistant application.

Tasks Performed :

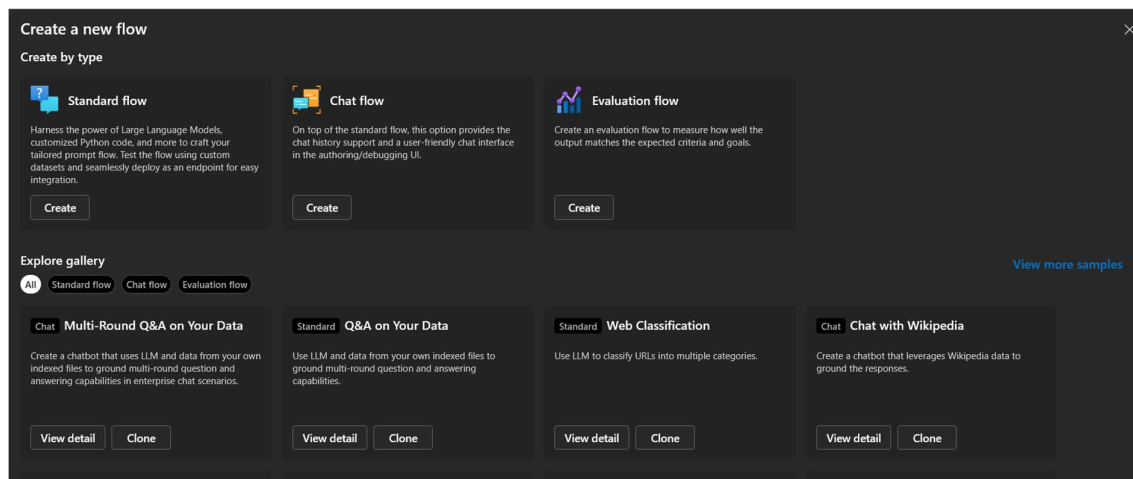

1. Opened Azure AI Foundry, created a new Standard Prompt Flow, and started the compute session.

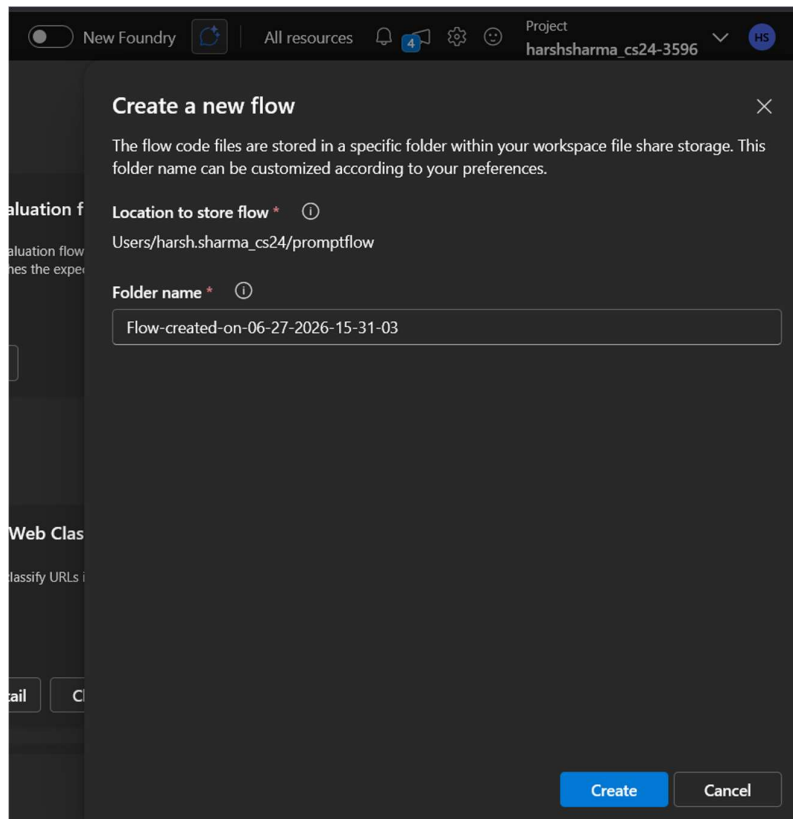

2. Opened Azure AI Foundry Prompt Flow and started creating a new orchestration flow.1

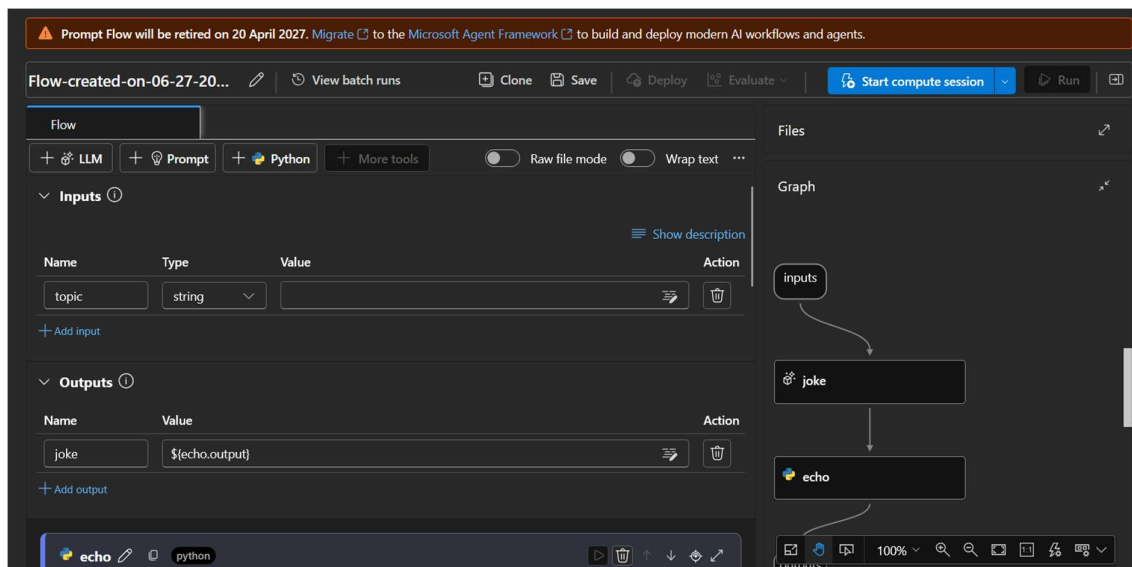

3. Selected the Standard Flow option to build a prompt-based AI workflow in Azure AI Foundry.

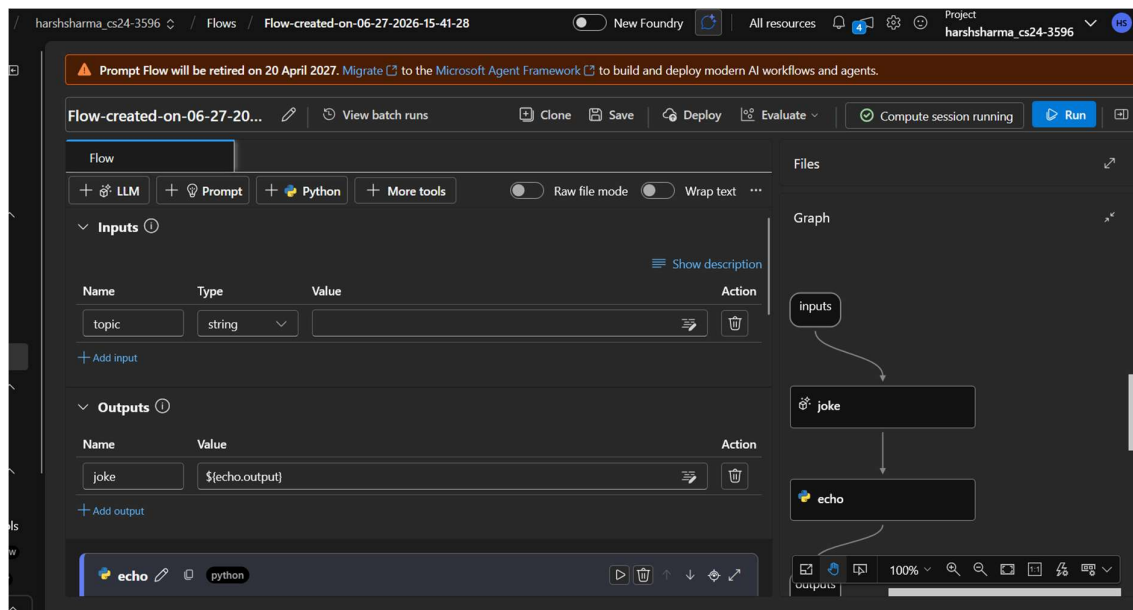

4. Configured the storage location and created a new prompt flow in Azure AI Foundry.

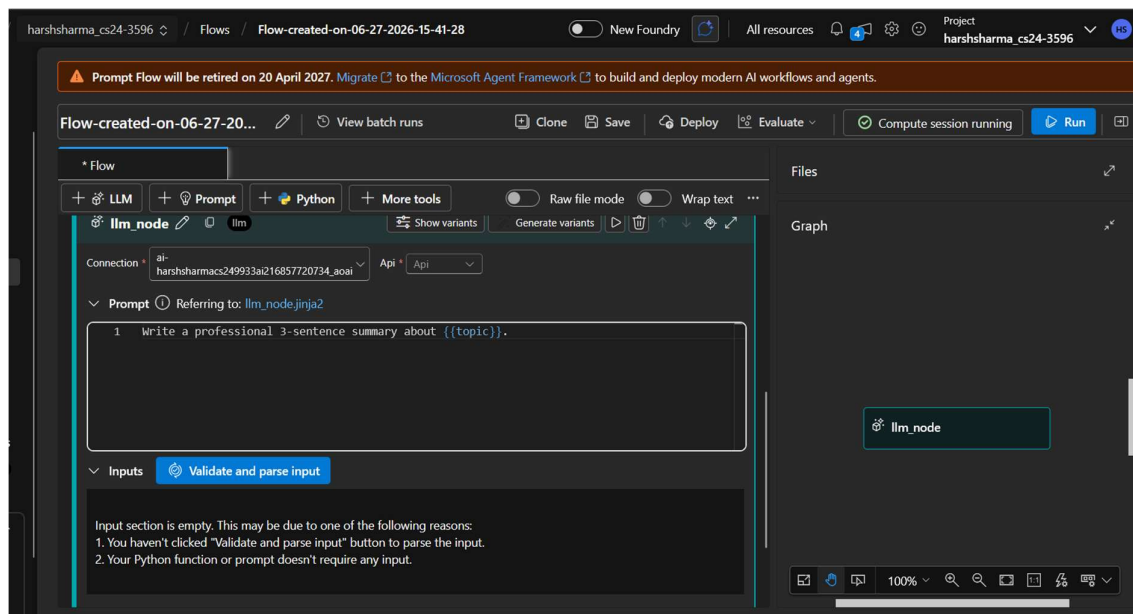

5. Created a new Standard Prompt Flow and viewed the default flow canvas with input, output, and Python nodes.

6.

7. Connected the LLM node to the Azure OpenAI resource for executing prompt-based AI tasks.

8. Entered the input topic, executed the prompt flow, and generated the response using the GPT-4.1 model.

Prompt Flow will be retired on 20 April 2027. Migrate to the Microsoft Agent Framework to build and deploy modern AI workflows and agents.

outputs

9. Successfully generated the desired output using the configured Prompt Flow and GPT-4.1 model.

Observations :

1. Prompt Flow enables visual orchestration of AI workflows using connected LLM nodes.
2. The Chat API requires prompts to follow a role-based format (system/user).

- 3. Input variables can be dynamically passed to generate customized AI responses.
- 4. Azure AI Foundry simplifies building, testing, and running prompt-based applications.

Results :

Parameter	Result
Prompt Flow Creation	Successfully Completed
LLM Model Used	GPT-4.1
Input Processing	Successful
Output Generation	Successfully generated the expected AI response

Conclusion :

Successfully created and executed a Prompt Flow in Azure AI Foundry to generate AI-powered responses using the GPT-4.1 model.
